SecureMail

Process Fusion 360

What is it?   01

SecureMail is your solution for sending files securely via email, featuring robust two-factor authentication.

02   How does it work?

Simply print to the SecureMail Queue or scan documents from Ricoh MFDs (HP, Xerox, and Lexmark compatibility coming soon). Recipients authenticate and retrieve attachments using a verification code sent via email, SMS, or Call.

Why SecureMail?   03

Security Concerns: Traditional email attachments are vulnerable to interception.

Limited File Size: Sending large files via email can be cumbersome and unreliable.

How SecureMail Helps

End-to-End Encryption

Your emails are encrypted from the moment they're sent until they're opened by the recipient, ensuring sensitive information stays private.

One-Time Verification Code

An extra layer of security is added with a verification code sent to your email or phone. Only the intended recipient with this code can access the email content.

Secure Large File Transfer

Safely send large files without interception or unauthorized access, ideal for businesses handling sensitive data.

Policy-Based Encryption

Emails are automatically encrypted based on predefined policies, ensuring adherence to organizational security standards.

Real-Time Tracking

Track the status of your emails and attachments in real-time, offering visibility and control over your sent information.
