Smart Label Printing

Maximizing patient safety and improving their quality of care is the overall goal of any healthcare organization.

Improve healthcare workflow and printing accuracy with UniPrint Infinity's smart label printing module. The software enables healthcare workers to simply print direct to any specialty printer (label, prescription, laser etc.) of their choice, without having to worry where their print job is being released.

The smart label printing module provides the foundation for eliminated printing errors and driving productivity throughout the organization. Print prescriptions and labels with total confidence.

Key Features & Benefits:

- **Improve Healthcare Operations:** Enable healthcare workers to quickly and easily manage accurate specialty printing for label and prescription medication.
- **Reduce Prescription & Label Printing Errors:** Print with complete confidence that the correct patient data information, medication, and dosage will be released to the right printer.
- **Reduce Print-related Expenses:** With less printing errors, save on costly label & prescription paper and wasted printer-related helpdesk calls.

How it Works:

A healthcare user prints from their device to the virtual print queue (VPQ). UniPrint's UPD converts and encrypts the print data into a PDF print job and stores it in a holding server.

The user then authenticates at the vPad device and to pick up label jobs only, the application prints with a description label.

A filtering mechanism is placed into the vPad and anything that matches that specific description will only pull label print jobs to pass through to the label printer.
