Your Systems Are Already Talking. But Are They Acting?

Connect industrial AI to the equipment and systems behind your operations so data, decisions, and actions can move together.

Your business runs across ERP, MES, SCADA, Microsoft 365 and more. When they don't work together, your teams become the connection: moving information, chasing updates, carrying work between systems. Verovia connects AI to each one, so routine work moves on its own.

Connectors: Unify shop floor and office workflows

Dynamics 365 · Microsoft 365 · Copilot · Azure SQL · Fabric · Tag · AUGURY · SAMSARA · Ignition

Connecting IT and OT today usually means custom development for every system and every integration has its own security review. Verovia connects them once, under IT's control. Every Star Agent, app, and workflow you build after that reads from those systems and, where authorized, acts on them, without a new integration project each time.

Authorize → Connect → Test → Use → Govern

One connection shared across Star Agents, apps, and workflows

Microsoft-first, built to extend

Built around Microsoft 365 and all of Dynamics 365, then extends across the business and operational systems your processes depend on.

From shop floor to business operations

Bring SCADA, PLCs, sensors, and equipment systems alongside ERP, MES, supply chain, finance, and HR, so signals can trigger workflows that can be automated and alert the experts only for critical issues.

Read and act, not just read-only

Access approved data and, where authorized, create, read, or delete data under your control.

Govern every connection, end to end

Decide who can authorize a connector and under which identity, set what it's allowed to reach, and review exactly what it did, with approvals and audit trails built in.

Connect everything, even with no API

An approved connection reaches every Star Agent, app, and workflow including older systems, through an integration bridge or computer use. A Star Agent works the screen directly to pull data or handle repetitive tasks. No system stays in orbit alone.

Verosoft

Move work faster across your installations

- Automate work across the business and teams of experts
- Every site can run its processes faster by having the right data on time
- Cut the exports, emails, meetings and follow-ups between critical resources
- Reuse connections across teams and sites
- Connect to where your data actually lives, like Azure SQL, Snowflake, and other data platforms

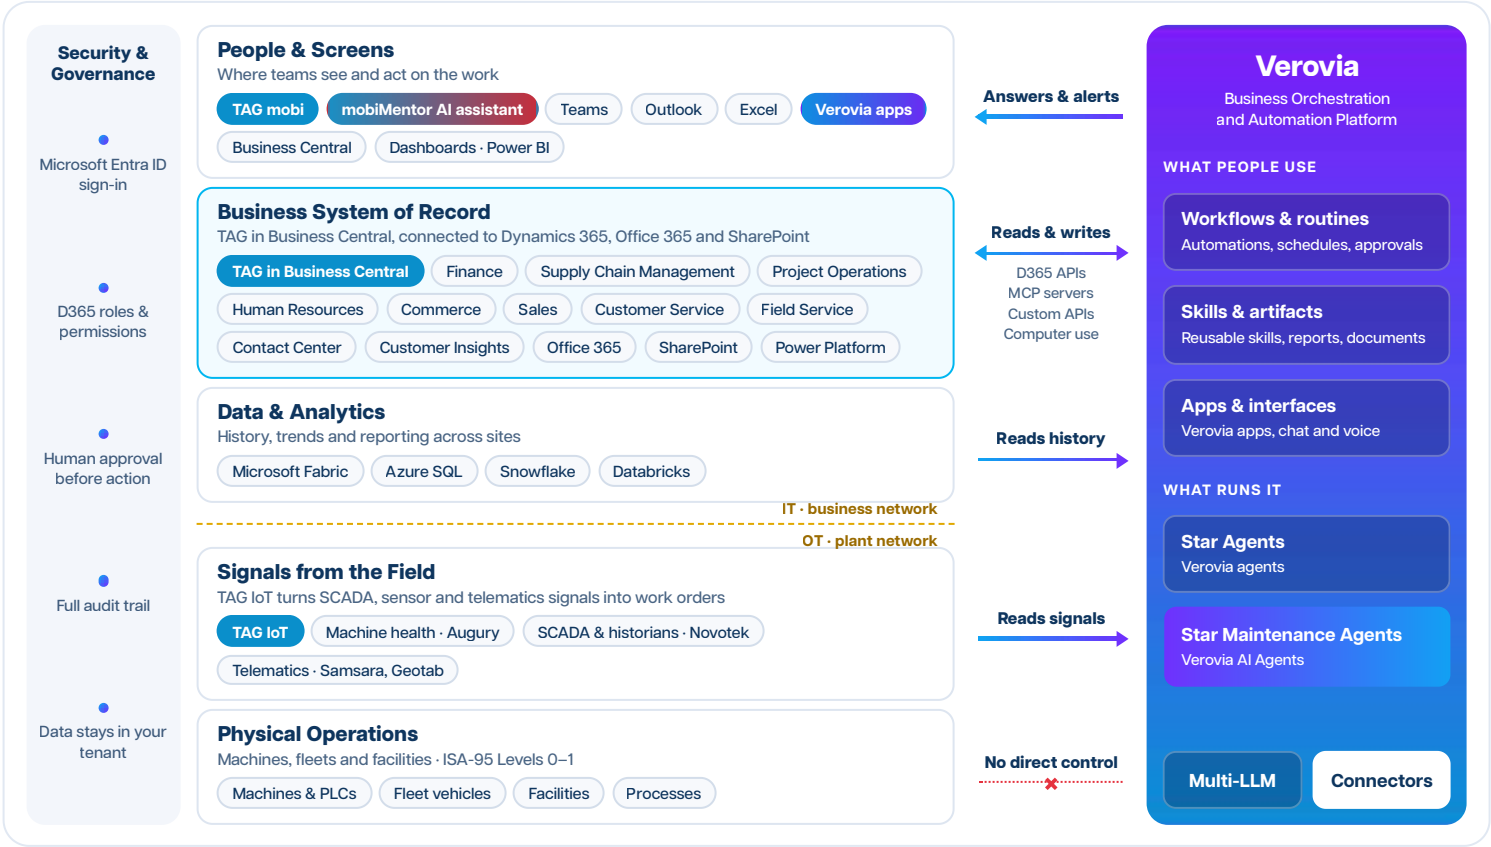

Fewer than 40%

of ERP installations expose composable APIs

How Verovia Works with Dynamics 365

Verovia is a Microsoft-first AI orchestration and automation platform. People use its workflows, skills and apps, while Star Agents do the work across every layer.

Verovia data and actions · IT / plant network boundary · No direct connection · TAG products · mobiMentor AI · Verovia

Read the stack from the bottom up: machines produce signals, signals become data, data informs the business record, and people act. Verovia reads and writes business data through D365 APIs, MCP servers, custom APIs and computer use.

Prove it in your own environment

Deploy a governed workflow on your live systems for **free**, with no migration required.
